Knowledge organiser · climate action and evidence

Today I can

I can distinguish mitigation from adaptation.

I can connect an action to a scientific mechanism.

I can choose a baseline and repeated measure before making a claim.

Mitigation means reduce a cause. Adaptation means cope with an effect. Both can be useful. They do different jobs.

An action needs a mechanism: say how each step could help. Where fossil fuels supply energy, lower demand can mean fewer emissions.

Safe shade can cut heat harm. That shade mechanism does not directly cut the cause of warming.

A baseline is what happens before. Use the same measure before and after. Repeat it. Keep conditions comparable.

The invented light-minute totals are 300 before and 90 after. They show less wasted-light time in that sample. They do not measure electricity, carbon or a global climate result.

Plan first. Keep one limit in view. A poster or a promise alone does not show success. Use approved paper scenarios. No live site action is needed.
