

Autumn Science Review Map

Organise previously learned observations about skeletons, nutrition and rocks into an evidence map, then identify what each observation can and cannot support.

[Open the original interactive lesson](#)

Retrieve without guessing

Skeleton work used named parts and models to connect structure with support, protection or movement.

Nutrition work compared labelled information on the same basis before drawing a conclusion.

Rock work described visible properties and used controlled tests for properties that cannot be judged safely by appearance alone.

A record becomes useful evidence only when its source, question and limit remain clear.

Retrieve without guessing

Arrival decision: Choose one available record and identify what it shows. If it is unavailable, mark it MISSING rather than recreating it.

How can a review map keep three science topics separate while still showing how evidence supports an explanation?

Picture first: three topics, kept separate. Every record you own belongs under one of them.

Commit before explanation. Use the supplied record, compare the available options and keep any first prediction open to revision.

Checking questions:

- What can be read directly from the record?
- Which words are interpretation rather than observation?
- What method or comparison basis must be named?

How can a review map keep three science topics separate while still showing how evidence supports an explanation?

- What would be unsafe or dishonest to infer?

How can a review map keep three science topics separate while still showing how evidence supports an explanation?

Three autumn topics as a map

Model the thinking

Record → topic → what it shows

Choose a record from the autumn evidence folder, then the topic it belongs to.

Model the thinking

- A. a sorted mat of vertebrates and invertebrates
- B. a table of after-wipe scratch results
- C. a plan with CHANGE / MEASURE / SAME boards
- D. a labelled arm model showing biceps and triceps
- E. a sketch of the sealed water bench with mL collected
- F. four sugar labels ordered per 100 g
- G. body science
- H. rocks

Model the thinking

I. fair tests

OBSERVATION what was seen, measured or recorded

EVIDENCE an observation used for a stated question

LIMIT what the available record cannot establish

- Read the supplied record without improving it.
- Name the task or question it addresses.
- Make one bounded response.
- Add a limit or checking point.

Model the thinking

- Check that no missing detail has been silently supplied.

A learner places ‘Sample B allowed less water through in the stated test’ under rocks. Which follow-up keeps the claim honest?

Everyone commits through pointing, selecting, saying, signing, typing or directing an adult. Compare the bounded and over-strong responses, then answer a fresh example.

Connect the second idea

Same reasoning move

Connect only records that share a named reasoning move.

Different evidence job

Keep each source attached to the question it can address.

Honest absence

Use MISSING or AWAITING AUTHORISED CHECK rather than filling a gap.

Name the connection explicitly. Remove any link that cannot be explained from the supplied material.

Decision lab

Supported

Sort nine supplied record cards into the three topic headings. Choose one sentence frame per topic: 'The record shows _____. It can support _____. It cannot show _____. An adult may read each card exactly and place it only as directed.

Standard

Select two records per topic, write a cautious claim for each topic and add a specific evidence limit. Explain one fair-comparison link between nutrition labels and a rock test without mixing their conclusions.

Stretch

Decision lab

Evaluate the strength of one record from each topic by considering method, comparison basis and uncertainty. Defend one cross-topic connection and reject one tempting connection that the evidence does not support.

Independent evidence

Supported

Sort nine supplied record cards into the three topic headings. Choose one sentence frame per topic: 'The record shows _____. It can support _____. It cannot show _____. An adult may read each card exactly and place it only as directed.

Standard

Select two records per topic, write a cautious claim for each topic and add a specific evidence limit. Explain one fair-comparison link between nutrition labels and a rock test without mixing their conclusions.

Stretch

Independent evidence

Evaluate the strength of one record from each topic by considering method, comparison basis and uncertainty. Defend one cross-topic connection and reject one tempting connection that the evidence does not support.

Trace

Keep the source, material or action locator visible.

Demand

Supported, Standard and Stretch change the task demand rather than merely softening a verb.

Independent evidence

Truth

Use PRESENT, MISSING or AWAITING AUTHORISED CHECK; never stage a record.

Exit route remains available: pause, use the print pack, reduce visual density or direct an adult. The named learning demand remains available.

Audience receives; Influence changes one next action

Choose one topic. State the record, the claim it supports and one limit. The receiving adult repeats the science back without upgrading it. Confirm, correct or point to the part that needs changing. Then choose the next honest action: retain the claim, add the missing method detail, or mark the question as still open.

Final check: no result, quote, date, event or pupil wording has been created to make the map look complete. The HTML stores no learner response.
