

Body Science Checkpoint

BUILD • Science • 40 minutes

I can use models and evidence to show what I know about skeletons, muscle pairs, nutrition, balance and food sources.

Name: _____ Date: _____

You may write, type, say, sign, point or direct a partner. An adult can read the words and record your exact response. Keep the choice and explanation your own.

Words for this lesson

Word	Meaning
support	hold up and give shape
contract	shorten and pull
nutrition	getting what the body needs from food

First idea

A pupil says, 'The bone pushes the muscle, so the arm bends.' Which idea should the checkpoint test?

- A. Keep it: bones push muscles to make them shorter.
- B. Test the pair: one muscle contracts and pulls while the other relaxes.
- C. Ignore the arm model and compare sugar labels instead.

My first idea and reason:

A simple skeleton with the words support, protect, move

We do • choose, explain, check

When the biceps contracts to bend the elbow, what should the triceps do in the simple model?

- A. Relax while the biceps pulls the forearm bone.
- B. Push the bone from behind.
- C. Contract fully in the same direction as the biceps.

My choice: _____ Evidence or reason:

Four-Strand Body Science Checkpoint

Route each evidence card to the strand it checks. Then choose one strand to explain and one to revisit.

Read or hear one card. Choose a group. Give the evidence. A partner checks your reason before you move on. Point or write card numbers; cutting is optional.

Group	Card numbers and evidence
SKELETON / BACKBONE	
MUSCLE PAIR	
NUTRITION / BALANCE	
FOOD SOURCE / CHAIN	

Activity cards

1 • Skull around the brain A hard bone surrounds and guards the brain.	2 • Snake X-ray shows an internal spine The animal has a backbone even though it has no legs.
3 • Biceps becomes shorter The muscle contracts and pulls the forearm bone to bend the elbow.	4 • Partner relaxes during the bend In the simple model, the triceps relaxes while the biceps contracts.

5 · Energy, growth and repair

Different nutrients support different body jobs.

6 · A varied pattern across food groups

No single food or sugar value describes a balanced dietary pattern.

7 · Plant → caterpillar

The plant is the producer at the start of this simple chain.

8 · Caterpillar → bird

The bird is a consumer that obtains food by eating another animal.

Name one secure strand, one connection between strands and the exact next strand to revisit.

Your lesson record

Complete or direct four short checkpoint stations, preserve a piece of evidence from each and explain one connection between two strands.

Model helps us see

The four checkpoint strands make the half-term knowledge visible without turning one response mode into the only way to show understanding.

Model does not show

Models simplify bodies, joints, diets and food chains. This checkpoint samples key ideas; it is not a medical, dietary or full attainment diagnosis.

Supported

Complete one two-choice item at each station, then choose a secure strand and a next strand.

Use symbols, model handling or pointing. Read each option exactly and scribe the pupil's own explanation.

Standard

Complete all four stations, justify one response from each and connect two strands using because.

Use: ___ works with ___ because ___. My evidence is ___. Next I need to practise ___.

Stretch

Explain two cross-strand links, repair one misconception and evaluate one model limitation.

Keep the claim within the model and distinguish evidence from a wider health judgement.

Evidence target

One observable response from each strand, one because connection, the pupil's chosen next strand and an adult witness note naming independence and prompts.

Exit, Audience and evidence • W8B

Supported: Point to one secure strand and one strand to practise next.

Standard: Explain one connection between skeletons, muscles, nutrition or food sources using evidence.

Stretch: Repair one checkpoint misconception, state a model limit and choose the next teaching step.

What I said, and what it changed

Next I will _____.

Adult witness note

What was observed, and with what level of independence?

My evidence and explanation

What does this evidence not show?

Visual reference cards

These are diagrams or model views from the uploaded lesson. Use their labels and the card descriptions; they are not photographs of your own results.

An arm model bent at the elbow: the biceps is short and fat, the triceps long and thin

A plate of four food groups and a food-chain arrow from plant to caterpillar

Arm model showing biceps and triceps

Exit • one next step

After the adult has listened, what will you keep, improve or check next?
