

Genetic Conditions: Present Evidence with Care

I can present an evidence-led explanation of a teacher-approved genetic condition, credit sources, preserve uncertainty and respond to one audience question safely.

[Open the original interactive lesson](#)

Arrival · quiet retrieval

Choose the delivery route before editing: written display, narrated slides, approved recording, or private explanation to a trusted adult.

Question Carry the exact bounded W14L1 question. Do not widen it to personal diagnosis, prognosis or advice.

Evidence matrix Carry the two approved source locators, the agreement, the difference and the uncertainty from W14L2.

Foundation explanation Prepare the gene/allele and inheritance idea in accessible language, then distinguish probability from certainty.

Arrival · quiet retrieval

Audience route Select privacy, response mode and group size before performance. No pupil is required to disclose a personal connection.

Supported

Use a four-panel frame, prepared vocabulary and a private explanation to a trusted adult or approved recording route.

Standard

Build an independent evidence-led presentation with two credited sources, one uncertainty and one response-led revision.

Starter · create the question

Find the overclaim in a sample ending that treats inheritance probability as certainty.
Replace it with bounded wording.

Picture first: an evidence-led presentation credits sources, keeps uncertainty visible and never uses personal stories.

Presentation test

An accurate ending names the evidence, states the limit and returns to the bounded question. Confidence, volume and polished design never replace a source trail.

Starter · create the question

- A. “The sources guarantee what will happen to every person.”
- B. “The sources explain an inherited pattern but cannot predict one person's experience.”
- C. “The presentation can tell someone what treatment to choose.”

Starter · create the question

Four parts of a respectful research plan

Watch the decision trail

Presentation line checker

Choose a line from a draft presentation, then judge it.

Watch the decision trail

- A. According to [source, date], the condition is inherited in this pattern...
- B. My cousin has it and...
- C. The two sources disagree on how common it is; the more recent gives...
- D. Everyone with the condition experiences...
- E. It is not yet known whether... — the sources say more research is needed
- F. This treatment cures it
- G. evidence-led, sourced, careful
- H. rewrite — personal, absolute or unsourced

Watch the decision trail

Frames 3–4: source evidence, variation/uncertainty, credits and a no-advice boundary.

Opening State the question and explain why it is bounded. The audience knows what the presentation will and will not answer.

Biology core Use gene, allele, inheritance and probability accurately at Foundation level. Define terms before adding detail.

Evidence comparison Name both approved sources, their relevant agreement and one difference or limitation from the matrix.

Watch the decision trail

Closing State variation and uncertainty, credit the sources and name the no-diagnosis/no-advice boundary.

Choose, then justify

Choose one question the evidence can answer and one that must be held for a qualified professional or a better source.

Answer Use the matrix when the question is within C44 and the approved evidence supports a bounded response.

Clarify Ask what the audience means when a word such as risk, cause or inherited is ambiguous.

Hold Say “The approved sources do not answer that” when evidence, scope or professional authority is absent.

Choose, then justify

Redirect Move personal health or safeguarding concerns to the school's approved support route, outside the presentation.

Accuracy includes limits

Receive the question without requiring public disclosure or immediate performance.

Revise when the evidence supports a clearer or more accurate statement.

Hold the wording when the question asks for diagnosis, advice, personal data or evidence the sources do not provide.

Revise The audience notices a missing source credit, unclear term or wording stronger than the matrix supports.

Hold The audience asks for certainty, diagnosis, treatment advice or personal/family information.

Accuracy includes limits

Add a gap The question is scientific but the two-source set cannot answer it. Record the gap and a future source-check action.

Keep authorship The learner chooses the change and explains why. Adult exact-word scribing remains labelled as support.

Build the route together

1 · Locate

Point to the exact slide, card or sentence where each source is credited.

2 · Connect

Explain how one source finding supports the bounded inheritance statement.

3 · Limit

Rehearse a safe hold sentence for a question outside the evidence or authority boundary.

Build the route together

Opening rehearsal Question, respectful title and one-sentence Foundation core explanation.

Evidence rehearsal Agreement, difference and uncertainty with both local source locators visible.

Audience rehearsal Private think time, one approved question and the choice to answer, clarify, hold or redirect.

Closing rehearsal State what the evidence supports, what it cannot predict and which source check could happen next.

Build the route together

The W14L2 evidence matrix, its two teacher-approved local sources, and current-main LAUNCH Science W12–W13 lessons.

Run a sixty-second paired rehearsal without personal examples. The listener names one source link and asks one bounded question; the speaker records a justified revise/hold decision.

Make the evidence trail usable

Create and deliver the presentation through the agreed private or small-audience route. Include the question, inheritance explanation, two credited source findings, variation/uncertainty and the boundary. Record the audience question and your evidence-led revise/hold decision.

A · Build Create four clear sections: question, Foundation biology, two-source evidence comparison, and variation/uncertainty with source credits.

B · Deliver Use the agreed written, narrated, recorded or private route. Do not require public performance or a personal connection.

Make the evidence trail usable

C · Receive Take one approved audience question. Answer from evidence, ask for clarification, hold, or redirect safely.

D · Record influence Write the question, the decision to revise or hold, the evidence reason and the exact visible change or future check.

Opening check State the bounded question, why it matters to the C44 research outcome and which approved sources will be used. Do not open with a dramatic personal story, an unverified statistic or a question that invites the audience to disclose health or family information.

Make the evidence trail usable

Science check Explain the Foundation relationship among gene, allele, inherited combination, probability and variation before adding detail. Keep source evidence separate from learner reasoning. A presentation should help the audience follow the biology, not reward technical vocabulary that has not been explained.

Credit check Place a short publisher and local-locator credit beside each used finding, then keep the fuller source trail in the evidence matrix. An image, diagram or number needs the same trace as prose. Remove material whose origin or relevance cannot be checked.

Make the evidence trail usable

Audience check Invite a question about the science or evidence, not about anyone's body or family. Receive it, classify it as answer, clarify, hold or redirect, and state the reason. A respectful hold is stronger than a confident answer the approved sources do not support.

Supported

Use a four-panel frame, prepared vocabulary and a private explanation to a trusted adult or approved recording route.

Standard

Make the evidence trail usable

Build an independent evidence-led presentation with two credited sources, one uncertainty and one response-led revision.

Stretch

Evaluate a misleading deterministic claim, explain why the evidence does not support it and adapt the presentation for a different audience.

One evidence link, one limit, one next step

Complete: 'The evidence supports...; it cannot predict...; the audience asked...; I revised/held because...'.
Evidence link Name one supported inheritance statement and the two approved locators that underpin it.
Limit State what the evidence cannot diagnose, guarantee or advise for an individual person.
Audience influence Describe the exact revision or hold and why the matrix justified that response.

One evidence link, one limit, one next step

Next check Name one missing source, wording or accessibility action and who owns it.
