# Recording our plant growth

Record growth (links Science).

Gardening and enterprise
Resilience & Change

# Our real measurements

Find the original tray and marked-shoot code.

Measure height, count whole leaves and note condition.

Use the same method and keep roots undisturbed.

The adult models the endpoint and the leaf to count.

# A consistent recording method

| Measure | What to record |
| --- | --- |
| **Height in cm** | Same shoot, endpoint and precision. |
| **Whole leaves** | Expanded leaves at the main stem, not leaflets. |
| **Condition** | Factual words such as green, pale or leaning. |
| **Identity** | Original tray and shoot code, with the week. |

Record unavailable values honestly. Missing is not zero.

# Our group line graph

Choose reliable weekly figures for the same marked shoot.

Use week number and height in centimetres.

Leave missing values as gaps and break the line.

One current point is valid if earlier figures are unavailable.

# A missing measurement

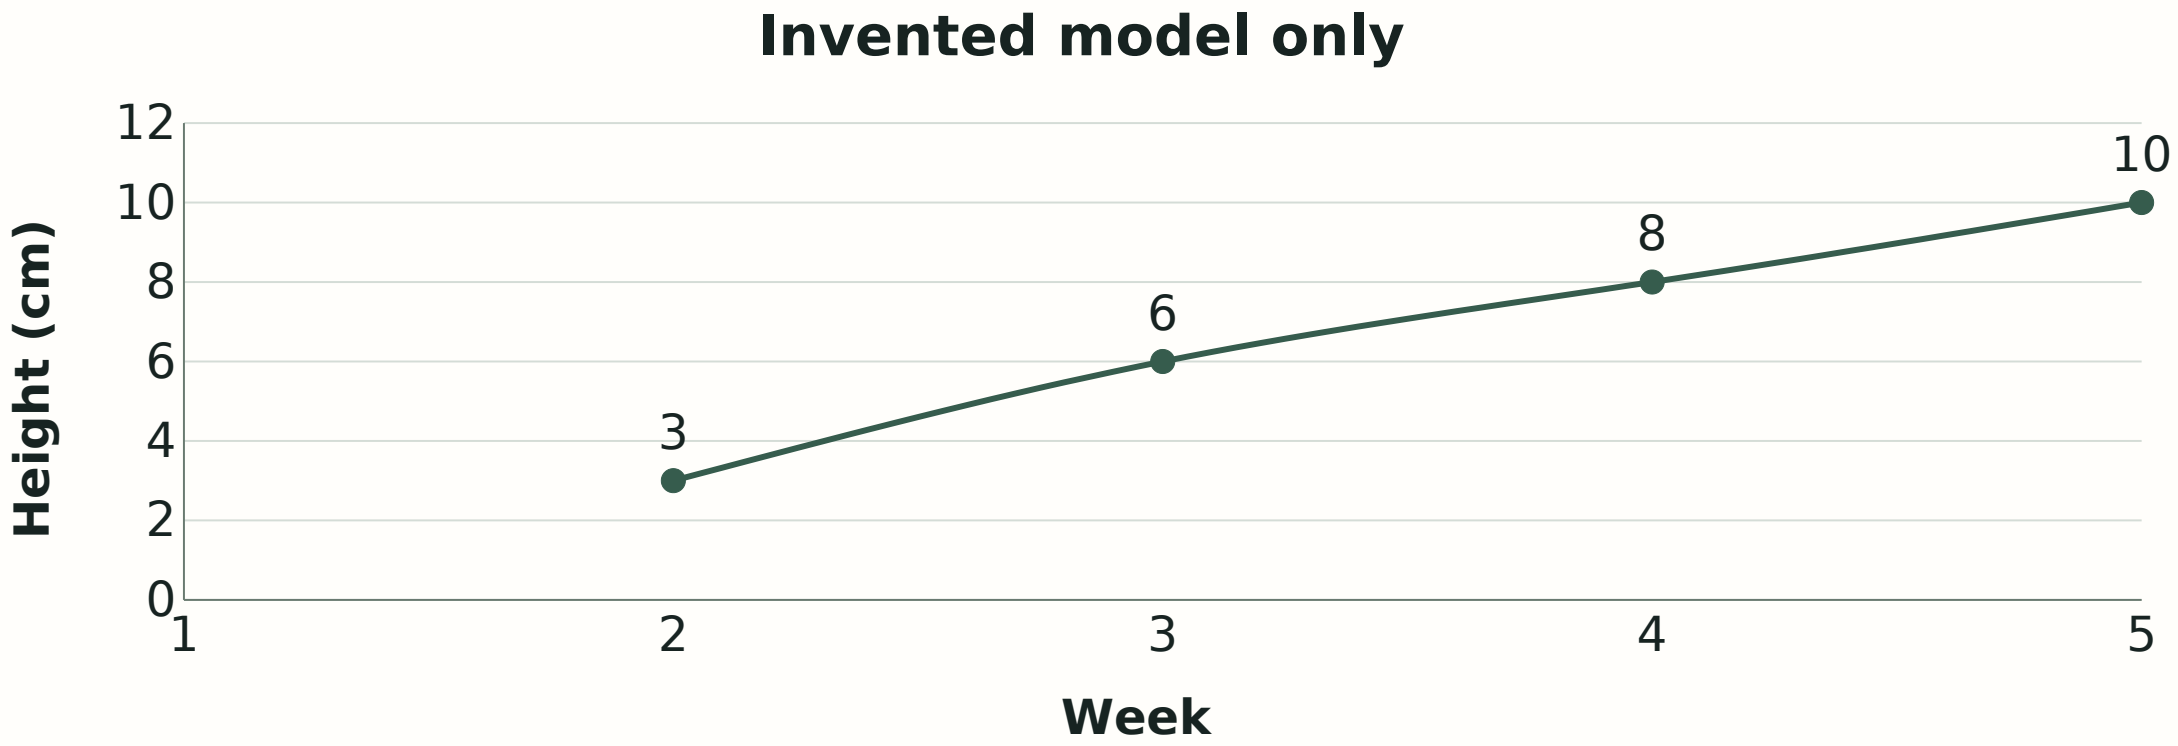

A real Week 3 height was not recorded.

A  Add zero to complete the line.

B  Leave a gap and explain the missing value.

Which choice keeps the record accurate?

# A model line graph

Week 1: no emergence, so no height point. This is invented data.

# Our pattern and evidence

Our recorded height changed from ____ to ____ cm.

This was between Week ____ and Week ____.

Light, water and warmth may affect the pattern.

Use actual figures. One point cannot show change over time.

# Review and exit

Check our table, graph labels and any gaps.

Describe the pattern and one limit of our evidence.

Return tools, wash hands and confirm the next care check.

Keep all earlier records and the original tray code.
