Growth measurements and model graph

White standard edition

Record growth (links Science).

Measure the same thing

Keep the tray and marked shoot code. Use the earlier agreed method and precision. For a new method, read vertical height from the medium surface to the main-stem growing tip, in centimetres. Do not pull or stretch the plant. Mark a method change rather than joining incompatible values.

Count leaves and notice condition

The adult shows one whole open pea leaf group where its stalk joins the main stem. Count each whole expanded leaf once, not its leaflets, tendrils or stipules. Describe colour, firmness or leaning. A taller plant is not automatically healthier.

A graph and a careful explanation

A growth line graph uses repeated values for the same shoot or a genuinely consistent recorded series. Put week on the horizontal axis and height in centimetres on the vertical axis. Use equal scale steps. Missing is not zero. Light, water and suitable warmth can affect growth, but a pattern alone does not prove which factor caused it.

Growth measurements and model graph continued

White standard edition

Invented model only

Fictional shoot M. Not our plants or a growth target. Week 2 to Week 5 rises by 7 cm; this does not prove a cause.

Week	Invented height in cm
1	No shoot visible; no height point
2	3
3	6
4	8
5	10
