Knowledge organiser

Use cell number, specialised features and function to distinguish processes.

I can explain how a stem cell divides and how some of its descendants become specialised for a job.

Tier	Word	Meaning
Tier 2	feature	A part or property we can describe.
Tier 2	function	The job something does.
Tier 2	evidence	Information used to support a claim.
Tier 2	compare	Describe what is alike and what differs.
Tier 3	mitosis	Division of a nucleus to produce two nuclei with matching inherited information.
Tier 3	stem cell	A cell that can divide and give rise to specialised cell types.
Tier 3	differentiation	The process in which a cell becomes specialised for a particular job.
Tier 3	meristem	A plant region with cells that divide to make new cells.
Tier 3	elongation	An increase in the length of a cell.
Tier 3	specialised cell	A cell with features suited to a particular job.

Must know: Division adds cells. Differentiation gives specialised roles. Stem-cell types differ in their range. Plant growth can include elongation.

Check the claim: More cells does not by itself show a new cell type. Model arrows do not prove treatment success.
