The skin model shows division followed by differentiation in some descendants.

I am learning to explain growth and differentiation and use evidence to repair claims about stem cells.

Tier 2 words

Word	Meaning
feature	A part or property we can describe.
function	The job something does.
evidence	Information used to support a claim.
compare	Describe what is alike and what differs.

Tier 3 words

Word	Meaning
mitosis	Division of a nucleus to produce two nuclei with matching inherited information.
stem cell	A cell that can divide and give rise to specialised cell types.
differentiation	The process in which a cell becomes specialised for a particular job.
meristem	A plant region with cells that divide to make new cells.
elongation	An increase in the length of a cell.
specialised cell	A cell with features suited to a particular job.

Sequence: In the root model: division → elongation → differentiation.

How I know: I can explain what changes in division, elongation and differentiation. I can compare skin repair with root growth. I can repair a claim using evidence and state what that evidence cannot show.

You can plan in any language. Speak before you write: “The evidence supports this claim because …”
