

Shared evidence • Atlas clues

The plant-parts atlas

Name _____ Date _____

Identify A-D on this simplified plant. Use location and shape clues.

Simplified flowering plant; shapes and sizes vary.

E • Observation record: a potted shoot has a visible stem and leaves. Its roots are hidden by the pot; no flower is visible today.

W1. Name A, B, C and D. Give one location clue.

W2. Improve “the plant in E has no roots or flowers”.

Route 1 • Build the label key

Word bank: roots / stem / leaves / flower.

S1. A branches below soil. Its name is...

S2. B is the upright connecting part. Its name is...

S3. Name C and D using the shared records.

S4. E lets us say...

A. Roots are hidden by the pot.

B. This plant has no roots.

S5. Name one part you would label on a plant drawing.

Route 2 • Make the atlas page

Draw a simple plant. Accuracy of labels matters more than artistic detail.

M1. Draw and label roots, stem, leaves and flower.

M2. Give one location clue for identifying a leaf.

M3. Can a green part be something other than a leaf? Give an example.

M4. Write one accurate sentence about what E does not show.

Route 3 • Review an unfamiliar view

A photograph shows a tall green stem with narrow leaves. Its base is outside the frame; it has no open flower.

T1. Name the two parts that are visible.

T2. Explain why the photograph cannot establish that roots are absent.

T3. Rewrite “this cannot be a flowering plant” as a careful observation.

T4. Design two useful views for a more complete plant atlas. Explain what each would reveal.

Exit and reflection

Point, draw, write or tell an adult.

E1. Name the branching part usually below soil.

E2. Name the part that bears leaves.

E3. Does no visible flower prove a plant never flowers?

R1. Which idea did you improve or defend? What evidence helped?

R2. What useful question would you investigate next?
