

A good plan can be followed by someone else

Learning intention

Plan a controlled comparison of water amount and plant growth, with repeated plants and consistent records.

Make the question precise.

Make the comparison fair.

Retrieve what makes a useful comparison

1. Name a plant-growth requirement.
2. Is height the only useful observation?
3. What unit can we use for height?

I repair two changes

Repair the comparison

Sunny window

Group A: 5 mL daily

Three matched seedlings

Dark cupboard

Group B: 15 mL daily

Three matched seedlings

Water AND light change: the cause becomes unclear.

The flawed plan changes water and light. I keep light comparable. Then I test water amount.

I define the measurement before taking it

Measure the same part, from the same starting level.

Do not include the pot or straighten the shoot by force.

Start at soil level. Measure to the main shoot tip. Record centimetres.

I make dates and responsibilities visible

The plan contains actions, not made-up results.

Same observation time; record every plant, including difficulties.

Record baseline first. Return on agreed days. Keep every plant's ID.

The plan-repair meeting

What will change? What will be measured? Name two things to keep comparable.

Plan part	Decision
Change	5 versus 15 mL daily
Repeat plants	Three per group
Record days	0, 3, 7, 10

Fictional teaching plan; future results are unknown

Prediction or result?

“I expect B to grow more.”

“B1 measured 6 cm today.”

Which requires an actual measurement?

Which plan best tests water amount?

Keep the intended change clear.

- A** Change water amount; keep species and growing conditions comparable.
- B** Change water amount, species and light together.
- C** Write the expected heights into the results table now.

Choose your science route

Assemble the core plan.

Write a handover method.

Audit and repair a weak plan.

Make your own evidence record

Use the shared evidence.

Explain one choice.

Check a label or number.

Check what the evidence can show

Point to the clue you used.

Remove an unsupported claim.

Lundy loop: improve the shared account

Choose how to share.

Hear one evidence-based challenge.

Improve or defend one idea.

Which repair would make the eventual evidence more useful?

Keep the useful change

What changed in our account?

Which evidence helped?

Three final checks

E1. What factor is this plan changing?

E2. Why use three plants per group?

E3. Should a prediction be copied into the results as a measurement?
