

Show the science you can explain

Learning intention

Use evidence to explain life cycles and apply selected spring science ideas in a teacher-authored checkpoint.

Today is a short teacher-authored checkpoint.

First practise how to use evidence.

The independent cases stay unseen until later.

Remember the evidence habits

R1. Why include units with a number?

R2. What does “in this test” tell a reader?

R3. Can an adult read a question without giving the answer?

I model how to answer, not the checkpoint

A worked example uses evidence

Training example only. Checkpoint cases come later.

I read the question before choosing evidence. I select a matching observation. I explain the link in one clear sentence.

I inspect the comparison conditions

Training: compare one condition

Same ramp height; change only the surface.

The training car and ramp height stay the same. The surface changes. A fair comparison reduces other explanations.

I bound the training claim

Separate observation from overclaim

Training sample data: A 60, 58 cm; B 40, 42 cm.
A claim must stay within the evidence.

The A values exceed the B values here. I use a pair of values with centimetres. I do not promise the same result everywhere.

Training editor: improve the response

W1. On which surface did the car travel farther in both trials? W2. Give one pair of numbers and units. W3. Repair “A always wins everywhere”.

Training surface	Trial 1 / cm	Trial 2 / cm
A	60	58
B	40	42

Constructed training data; different from the checkpoint.

Choose useful feedback

Response: “A is best because I like it.”

Which feedback helps: add a number, or write faster?

Explain your choice.

Prepare for independent work

Keep the response routine.

Put the training sheet aside.

Wait for your selected checkpoint page.

Which is a useful evidence sentence?

Use the training example only.

- A** A is better because it looks nicer.
- B** In trial 1, the car travelled 60 cm on A and 40 cm on B.
- C** The car must always travel farther on A in every situation.

Your independent investigation

Open your selected checkpoint route now.

Work independently on all three science cases.

Ask for reading support if needed.

Use the evidence

Use the evidence printed on your route.

Show a reason as well as a choice.

Put a question mark beside anything uncertain.

Check before sharing

Does my explanation answer the question?

Have I named the evidence or process?

Have I kept the conclusion within its limits?

Compare and improve

Submit before seeing the worked answers.

Compare one response with the criteria.

Choose one precise improvement.

A question worth investigating

Suggest one next question about this lesson's evidence.

Choose a question whose answer would improve our model.

Show the science you can explain

E1. Which science area is most secure for you?

E2. Write one corrected explanation after feedback.

E3. Name the evidence that supports it.
