

1 • Shared evidence: body dispatch

Body systems: the dispatch challenge

Name _____ Date _____

These are scientific job cards for a simplified model, not personal medical records.

A • Mouth

Chews food into smaller pieces; saliva begins digestion.

C • Small intestine

Continues digestion and absorbs most nutrients.

E • Blood vessels

Carry blood between the heart and body tissues.

B • Stomach

Mixes food with digestive juices.

D • Heart

Muscle contractions pump blood.

F • Delivery clue

Absorbed small nutrients can enter blood and reach tissues. Food pieces do not enter blood vessels.

W1. Sort cards A-E into digestive or circulatory. Explain one placement.

W2. Repair: “Stomach pumps blood. Heart breaks food down.”

W3. Repair: “Bread crumbs travel inside blood vessels.”

2 • Supported route: label the jobs

Use page 1. Point, circle, draw or dictate.

S1. Which system includes the stomach?

- A. Digestive
- B. Circulatory

S2. What does the heart do?

- A. Pumps blood
- B. Chews food

S3. Put A, B and C in food-route order. Name one job.

S4. Complete: Digestion makes some nutrients small enough to be _____. Blood then _____ them to tissues. Word bank: transports / absorbed.

S5. Draw a two-system panel: one digestive organ, the heart and labelled job arrows.

3 • Standard route: museum panel

Use page 1. Make the body-system connection clear to a visitor.

Organ	System	Job
Mouth		
Small intestine		
Heart		
Blood vessels		

N1. Complete the table. Use verbs that explain jobs.

N2. Describe a simplified food route through three organs.

N3. Explain how a nutrient can reach muscle tissue. Include digestion, absorption and blood.

N4. Repair the bread-crumble claim and explain why it was misleading.

4 • Stretch route: repair the exhibit

A visitor should leave with a useful model, not an incorrect shortcut.

T1. Write a 3-sentence panel linking digestion and circulation. Include named organs and the substance transported.

T2. A model has one box called “stomach” doing all digestion and pumping. Explain two changes it needs.

T3. Why is your panel still a simplified model? Name an omitted organ or process and explain the omission.

T4. Design one question to check whether a visitor understands the connection. Write your expected answer.

5 • Exit and reflection

Work independently; a labelled drawing or scribed explanation is welcome.

E1. What is the heart's job?

E2. Name one digestive organ and explain its job.

E3. Explain how digestion and circulation work together.

E4. Suggest a question about the heart for the next lesson.

Reflection. Which misleading label did you improve?
