

BUILD Textiles

Autumn 1 · Weeks 5-7 · Three 40-minute lessons

Three complete textiles lessons: explore fabrics and joins, design a small item, then make and evaluate it. Weeks 5-6 adapt the uploaded shared BUILD/GROW lessons; Week 7 is newly authored completion from the GROW scheme-of-work sequence. The BUILD route uses supported choices and clear process evidence.

Using this pack

- Open index.html for the lesson and download menu, or use the editable PowerPoints. Keep this teacher guide separate from pupil copies.
- Print the two pupil activity pages for the lesson and its resource cards. Check activity materials and individual access needs before teaching.
- The 40-minute plans include response time and a closing check. Record the level of support and the pupil response; a completed page alone does not prove independent understanding.
- The HTML lessons work offline after the ZIP is extracted. The online Lessons link and external source links need an internet connection.
- Source codes are retained as planning references only. This pack does not certify ASDAN or AQA achievement; check current centre requirements before banking evidence.

Lesson sequence

5 | Meet the materials and joins Describe two fabric samples, recognise three joining methods and record a supported comparison.

6 | Design my card pocket Choose a user, material and decoration, then communicate a simple labelled plan using the supplied pattern.

7 | Make my item and check it Follow a supported making plan, check the item against its purpose and name a next step.

Meet the materials and joins

Lesson 5 · 40 minutes

Describe two fabric samples, recognise three joining methods and record a supported comparison.

Before the lesson

- Print specimen, join and sample-data cards; provide known clean samples with accessible labels A-E.
- Prepare 100 × 30 mm fabric strips and 20 × 30 mm overlaps; pre-cut where needed. Use only approved cold adhesives and check material sensitivities privately.
- Prepare cured glue/tape specimens and a stitched display sample before the lesson, following actual product instructions. The default comparison uses supplied sample data.

Materials: Known clean cotton/felt/denim/jersey/net samples or the complete property cards; paper/card alternative.; Adult-prepared strips, ruler, pencil/chalk, school-approved cold fabric glue and tape, labelled drying tray, adult-prepared stitched display.; If an adult demonstration is approved: sealed 100 g test load, tray and suitable prepared holding fixture; pupils do not handle the load.

Minutes	Teach, practise and check
3	Arrive, choose role and introduce the question.
6	Observe or read material properties.
6	Model three join methods and fair comparison.
12	Make/inspect joins and label a drying sample.
7	Interpret sample results and match a join to a job.
4	Count and return scissors, tools and sample pieces; close approved adhesive containers, collect tape backings and scraps, wipe the work surface as directed and wash hands if needed.
2	Individual evidence-and-limit exit.

What success can look like

- I can show or name two fabric properties.
- I can identify glue, tape and a prepared stitch join.
- I can use one result to choose a join or ask for another check.

Care and boundaries: Follow the school practical-work risk assessment and individual access plans. The default lessons use no needles, pins, irons, hot glue, cord loops or loose buttons/beads. Adults control, count and return scissors and any small test equipment; pre-cut pieces are available. Use only school-approved cold adhesives according to the actual product instructions, check skin/material sensitivities privately, and keep glue away from eyes and mouths. Touching fabric, wearing an item or accepting physical guidance is never required. Agree support; use demonstration, pointing, an observer role or a paper/card model. Keep personal identifiers and pupil photos off public website files.

Assessment: Record a property with evidence, an accurate made/inspected distinction, a sample-result comparison and a reasoned join choice. Practical competence is recorded only for actions directly observed; no formal award is promised.

Support and teaching notes

Meet the materials and joins

Model the thinking

Bend a specimen, then give an observation rather than a universal claim. Trace the prepared stitched join. Model the distinction between a fresh sample and one ready for testing, then count successes across all three sample repeats.

Access and support

BUILD core uses two samples, one property contrast at a time and one test row. Offer pre-cut strips, adult-positioned tape and a paper alternative. The pupil can read, point, direct, make or record. Record the actual support and keep inspection distinct from making.

Extend the thinking

Explain one property or join choice using a because sentence, then name one check still needed. Extend only after the core practical or paper-model task is secure.

If the practical or activity cannot run

Use the complete specimen descriptions and invented test record. Learners sequence preparation, curing, testing and recording, and inspect a drawing or written stitch description without tools.

Likely misconceptions

- Bending is not the same as stretching.
- Fabric name alone does not establish all properties.
- A fresh adhesive sample cannot stand in for a correctly cured join.
- The supplied data do not show that stitch always wins or that a real bag handle is safe.

Model responses and checks

Meet the materials and joins

1. Describe two samples: B: soft, bends. E: bends or see-through. B is a sensible first choice; join still needs testing.

2. Name the joins: Glue; tape; stitch. Record the route actually used; prepared stitch inspection is not making stitches.

3. Read a result: Glue or stitch held; tape opened; leave wet glue to cure.

Exit check: Made means the learner completed the process; inspected means they examined evidence of someone else's join.

Fabric property cards

Pocket candidate: B, because this felt sample is soft, flexible and its edge stayed together. Its join still needs a suitable test.

See-through overlay: E. Its holes would be unsuitable for containing loose tiny items.

Stretch candidate: D. The amount of stretch and recovery must suit the real job.

A fabric name alone does not prove a property, suitability or join strength. Check the actual sample.

Three join cards | What changes?

A glue specimen must cure as directed before its performance can be judged.

Cold tape and iron-on tape are different products; the pack uses only the cold type.

Inspecting a stitched sample is valid learning, but must not be recorded as making a stitch.

Accept choices supported by the job and evidence; do not award a universal “thread wins” answer.

Join test | Sample data and fair comparison

Glue held in 3 of 3 sample tests; tape in 1 of 3; stitch in 2 of 3.

In this supplied test, glue gave the most consistent holding result. This does not prove glue is always strongest or suitable for a heavy bag.

Repeat 1 alone gives glue and stitch a tie. The other repeats add evidence.

Do not compare fresh glue with fully prepared tape/stitch and call that a fair test of the methods.

Slideshow responses

Meet the materials and joins

Meet the materials and joins: Observe or test the actual sample and record what happens.

Bend, stretch, see: Yes. These are different properties.

Choose between two samples: B is the better starting choice from this evidence. Its join still needs a check.

Three ways to connect: No. Use properly prepared samples or the labelled sample data.

Ready to test?: Leave it to cure. Use prepared samples or the printed results today.

Make, label, leave to cure: “Inspected a stitched join”, not “made a stitch”.

Read one sample test: Glue and stitch. One test does not prove which join is always best.

Match the join to the job: No. Its real load, repeated use, material and design need appropriate testing.

One claim, one limit: Fabric, strip dimensions, overlap, load, time or handling.

Design my card pocket

Lesson 6 · 40 minutes

Choose a user, material and decoration, then communicate a simple labelled plan using the supplied pattern.

Before the lesson

- Print the exact-size pattern, 50 mm scale check, brief and two original inspiration cards. Check print scale before class.
- Provide 100 × 170 mm paper blanks and 60 × 50 mm test cards for dry-fold modelling; no adhesive is required today.
- Trial the intended cold fabric tape with the actual fabric before Week 7. Choose paper/card model if tape cannot hold or be handled in the session under its product instructions.

Materials: Pattern, ruler, pencils/chalk, large paper, brief/idea/checklist cards, optional approved marker.; Known fabric samples or property descriptions; pre-cut paper blanks and test cards.; For flat-decoration choice: 100 × 70 mm backing and 60 × 50 mm front-panel paper models.

Minutes	Teach, practise and check
3	Recall one useful property and introduce user choice.
6	Read brief and compare original ideas.
7	Model dimensions, joins and a labelled drawing.
13	Create a labelled plan and dry-fold paper model.
6	Peer check, improve and sequence making steps.
3	Store plans, collect pattern pieces and reset.
2	Individual first-check exit.

What success can look like

- I can choose a purpose and a material.
- I can show the joins, folds and decoration on my plan.
- I can put three making stages in order.

Care and boundaries: Follow the school practical-work risk assessment and individual access plans. The default lessons use no needles, pins, irons, hot glue, cord loops or loose buttons/beads. Adults control, count and return scissors and any small test equipment; pre-cut pieces are available. Use only school-approved cold adhesives according to the actual product instructions, check skin/material sensitivities privately, and keep glue away from eyes and mouths. Touching fabric, wearing an item or accepting physical guidance is never required. Agree support; use demonstration, pointing, an observer role or a paper/card model. Keep personal identifiers and pupil photos off public website files.

Assessment: Look for user/purpose, testable checks, dimensioned material/join labels, a feasible sequence and a revision based on feedback. Assess design communication rather than drawing neatness; distinguish paper model from fabric construction.

Support and teaching notes

Design my card pocket

Model the thinking

Show the blank with the short edge at the top. Measure 30 mm then 100 mm from that same origin, not from the first fold. Trace the two side strips; demonstrate why tape across the opening would defeat the pocket's job.

Access and support

BUILD: offer two user/symbol choices, a pre-marked blank and ready-made labels. Show one fold at a time. Pupils can trace, point, dry-fold, direct a partner or dictate a plan. Maintain the same respectful purpose; do not judge artistic neatness.

Extend the thinking

Explain one property or join choice using a because sentence, then name one check still needed. Extend only after the core practical or paper-model task is secure.

If the practical or activity cannot run

All inspiration, dimensions and checks are included in print. Use the paper model only; if ruler access is difficult, offer exact pre-cut shapes and measure together.

Likely misconceptions

- A picture without dimensions and join labels may be hard for another maker to follow.
- Both folds are measured from the original top, not consecutively.
- Decoration must not close the opening or hide a faulty join.
- A prototype plan is not evidence that the finished join has passed a test.

Model responses and checks

Design my card pocket

1. Choose the job: Accept one coherent selection. Pocket must contain the card; flat decoration must keep its panels joined and show a symbol.

2. Show the design: Pocket: bottom panel up, flap down, two side joins and clear opening. Flat decoration: centred 60 × 50 mm front on 100 × 70 mm backing, with two side joins and no folds. Accept labelled drawing, tracing, pointing or dictated evidence.

3. Put the stages in order: Check; construct the chosen pocket or flat panel; test when ready. Credit a real added label, dimension, symbol position or join mark.

Exit check: So the maker leaves space for the card instead of joining every edge. The flat decoration does not need an opening.

Design brief | A small card pocket

The design is judged against purpose, card fit, side-join function and completeness of the plan. Colour preference alone cannot establish those checks.

A 60 mm-wide card fits the planned 80 mm internal width with 20 mm overall clearance, before material thickness and construction variation; test the real model.

No load-bearing or waterproof claim is made.

Pattern and fold guide | Exact dimensions

Top-origin fold coordinates: $y = 30$ mm and $y = 100$ mm; bottom panel height = 70 mm.

Internal width estimate: $100 - 10 - 10 = 80$ mm.

Front panel folds upwards; the top flap folds down. Closing all four edges would trap the card.

Two original design ideas | Compare and change

For Alex, a large symbol gives a specific purpose-based reason. For Rowan, a broad stripe can satisfy the stated preference.

Many colour and symbol choices are valid; assess labels, purpose and feasibility, not which design the adult prefers.

A flat decoration has a different function: check both panel joins stay attached after three gentle lifts from the desk. It is a legitimate simpler textile-item alternative, not a failed pocket.

Plan-review checklist

Missing details should lead to one clear revision, such as adding 30/100 mm fold marks or specifying the two side strips.

A valid plan for the flat decoration must use its different two-panel dimensions and attachment test rather than the pocket-card test.

Slideshow responses

Design my card pocket

Design my card pocket: Purpose, material, join, dimensions, decoration position and ordered steps.

What is the pocket for?: The top opening under the flap.

Compare two original ideas: One broad stripe or another simple agreed symbol, while preserving function.

Use the ready pattern: Upwards along the lower fold line.

Model the labelled plan: A relevant observed property, such as flexible/opaque with an edge that stayed together in the sample check.

A plan with a flaw: Keep the pocket opening clear; place tape only on the two planned side strips.

Make the choices visible: Write, select or dictate the chosen material name; add one useful property if ready.

Peer check: could I make it?: For example: adding fold measurements, marking the opening or naming the approved cold tape.

Plan the first safe step: No. The actual material, approved adhesive preparation and finished join still need testing.

Make my item and check it

Lesson 7 · 40 minutes

Follow a supported making plan, check the item against its purpose and name a next step.

Before the lesson

- Retrieve Week 6 plans. Prepare/pre-cut 100 × 170 mm blanks, two 10 × 70 mm tape strips and 60 × 50 mm paper test cards; premark folds where useful.
- Trial the actual cold tape/material combination and follow its pressing/handling/cure instructions. If readiness extends beyond class, plan the evaluation using a cured model or fictional records.
- Prepare a paper model for every pupil who prefers it. Ensure the flat-decoration alternative has 100 × 70 mm backing, 60 × 50 mm front and two 10 × 50 mm joining strips.

Materials: Prepared fabric/felt or paper blanks, appropriate school-approved cold tape, ruler, pencil/chalk, approved marker and paper test card.; Week 6 plan, exact pattern, construction card, brief and fictional prototype records.; Adult-controlled counted scissors if needed, table protection, waste tray and flat storage space.

Minutes	Teach, practise and check
3	Retrieve plan and choose role/material route.
5	Adult approval and model folds/joins.
17	Construct planned prototype or paper model.
7	Record function evidence and targeted improvement/retest or sample verdict.
6	Count and return scissors, tools and sample pieces; close approved adhesive containers, collect tape backings and scraps, wipe the work surface as directed and wash hands if needed.
2	Individual design-cycle exit.

What success can look like

- I can follow or direct the agreed making steps.
- I can show what happened in a check.
- I can name one thing that worked or needs changing.

Care and boundaries: Follow the school practical-work risk assessment and individual access plans. The default lessons use no needles, pins, irons, hot glue, cord loops or loose buttons/beads. Adults control, count and return scissors and any small test equipment; pre-cut pieces are available. Use only school-approved cold adhesives according to the actual product instructions, check skin/material sensitivities privately, and keep glue away from eyes and mouths. Touching fabric, wearing an item or accepting physical guidance is never required. Agree support; use demonstration, pointing, an observer role or a paper/card model. Keep personal identifiers and pupil photos off public website files.

Assessment: Observe plan use, an agreed safe action, accurate evidence recording and a targeted improvement. Mark met/not yet/need evidence against the selected pocket or decoration brief; do not infer practical competence from a finished photo alone.

Support and teaching notes

Make my item and check it

Model the thinking

Dry-fold a paper blank; show the open top and two side-strip positions. Model one gentle test cycle and a truthful “not yet” record if a join opens. Explain that a repair requires the product’s proper preparation before retesting.

Access and support

BUILD: pre-cut and premark all parts; offer one demonstrated action, then pause for a check. Accept a maker-director role, a paper model, pointing to results or adult scribing. Adult support is agreed and recorded without claiming independence.

Extend the thinking

Explain one property or join choice using a because sentence, then name one check still needed. Extend only after the core practical or paper-model task is secure.

If the practical or activity cannot run

Build the exact paper model or evaluate all three supplied prototype records. A learner can meet the evaluation objective without handling fabric or adhesive; label the route used.

Likely misconceptions

- A tidy appearance does not prove function.
- Opening on cycle 2 does not meet a 3-cycle holding check.
- Decorating cannot fix a structural join.
- A model or sample-data judgement must not be recorded as tested fabric construction.

Model responses and checks

Make my item and check it

- 1. What I did:** Accept accurate route and action. Do not record a model as a tested fabric product.
 - 2. What the check showed:** Fictional pocket: worked; not yet; worked. For a real decoration, record panel centring, both joins after three gentle lifts and the symbol. Record actual results; do not use the pocket's sample results for a decoration.
 - 3. One next step:** Repair/replace or redesign the join; repeat the gentle check; leave it to cure and record not checked.
- Exit check:** A specific change linked to the brief or evidence, followed by the relevant recheck when safe.

Make the pocket | Complete construction card

Correct pocket folds: bottom up at 100 mm; flap down at 30 mm from the original top. Side tape belongs only on the bottom panel's two outer 10 mm strips.

Expected pocket checks: test card slides in/out; both joins remain attached for three gentle cycles; planned symbol is visible; opening stays clear. Actual results may differ and must be recorded.

A not-yet-tested record is correct when adhesive or marker needs longer to cure; the pupil can evaluate the provided sample record meanwhile.

Flat decoration: finished backing 100 mm × 70 mm; centred front 60 mm × 50 mm; no card-containment claim.

Prototype records | Fictional results

A: all stated checks are supported by the fictional record.

B: size, initial card fit, visible stripe and approved process are supported; the side-join requirement is not yet met. Repair/retest the join.

C: dimensions and approval are recorded, but card fit and join function need evidence; the symbol is not yet added. Do not test before the join is ready.

A tidy photograph cannot prove a join test or the original material/tool approval.

Slideshow responses

Make my item and check it

Make my item and check it: The 60 × 50 mm card fits and both side joins hold through three gentle cycles.

Check before making: Record not yet tested, let it cure and use the supplied fictional record or ready paper model for evaluation.

Fold first, then join: No. The card needs an opening.

Construct from your plan: The side joins and edge or panel alignment match the chosen pattern. A pocket's opening remains clear.

A controlled function check: Both joins remain attached through all three gentle checks for the chosen item. These results apply only to this limited classroom task.

What happened to Pocket B?: No. It needs a repair or change, then another check when ready.

Improve one useful thing: No. Repair or redesign the join under adult direction, then retest it.

Show one result: Not checked yet. Leave it for the required time.

Show the design cycle: No. It cannot establish test cycles, cure time or the original material/tool approval.
