

Design my card pocket

Plan a small card pocket, with a flat-decoration alternative.

Choose a fictional user or keep your idea impersonal.

What should the drawing tell the maker?

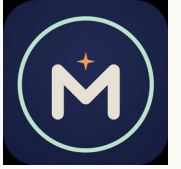

Words that help

BRIEF

The job and checks that a design must satisfy.

PROTOTYPE

A first version made to explore and test a design.

What is the pocket for?

The club helper needs a small desk pocket for a paper task card.

The card must go in and come out.

Both sides must stay joined during three gentle checks.

Which edge must stay open for the card?

Compare two original ideas

Signal pocket: a large triangle on the front.

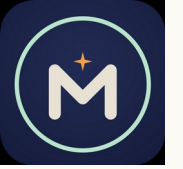

Stripe pocket: two broad drawn stripes.

Both keep the opening and side joins clear.

Compare two original ideas — continued

What would you change for Rowan, who wants a quiet, simple design?

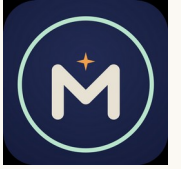

Use the ready pattern

One blank: 100 mm wide and 170 mm high.

The two fold lines are already marked at 30 mm and 100 mm from the top.

Match your paper card to the pocket before adding any tape.

Which way does the bottom panel fold?

Model the labelled plan

Name the actual sample and the property evidence behind its choice.

Show where each cold join goes and which edge stays open.

Place a symbol on the outside front, away from joins.

What is missing from “Use felt because it is good”?

A plan with a flaw

The drawing marks tape across all four edges.

It says “card pocket”, but no edge is left open.

What must change before making?

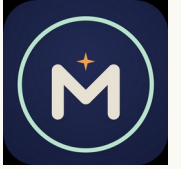

Make the choices visible

Choose Alex or Rowan, then choose a felt sample or paper model.

Point to where the two side joins go.

Add a large triangle or broad stripe outside the front.

What can you label so your partner knows the material?

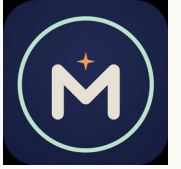

Peer check: could I make it?

Find user/purpose, material, join, size and decoration.

Check the making order for your item: pocket folds and opening, or a flat panel join.

Add one missing detail before saving the plan for Week 7.

Peer check: could I make it? — continued

Which change made your plan more usable?

Plan the first safe step

Finish: “Before I make, I need to check ____.”

Does a clear drawing prove the finished join will hold?
