

Enter, check and explain simple data

Today: build the chart from the fictional club votes used last lesson.

Use supplied counts only. We are not collecting class votes or personal data.

What is our question?

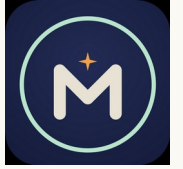

Words that help

CELL

A box in a spreadsheet, identified by column and row.

RANGE

A group of cells, such as B2:B5.

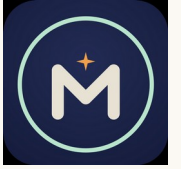

A cell has an address

Columns use letters; rows use numbers. A1 is column A, row 1.

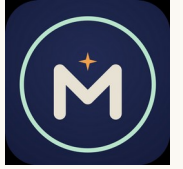

Put Activity in A1 and Votes in B1. Categories go in A2:A5; numbers go in B2:B5.

A label tells us what a number means.

A cell has an address — continued

What belongs in B3 in the supplied unsorted table?

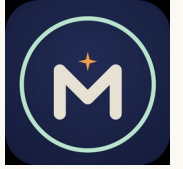

We do: enter and check one row

A2: Drawing. B2: 7.

Read across the row: “Drawing received seven votes.”

Compare both the label and the number with the source card.

Why read across instead of checking only the number?

You do: complete the four rows

Drawing 7; Model making 9; Coding 3; Gardening 5.

Enter all four pairs into A2:B5 in the supplied order.

Check every row against the printed source. These 24 votes are fictional.

What should you do if your count differs from the card?

A formula totals a range

Put Total in A7. In B7 enter =SUM(B2:B5).

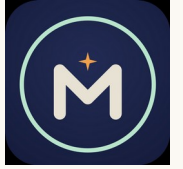

The result should be 24. Check that the formula includes all four vote cells.

A correct total is useful, but it does not prove every row is correct.

A formula totals a range — continued

If Drawing and Model making counts are swapped, would the total still be 24?

Sort the whole table together

Select the complete A1:B5 table, including the headings.

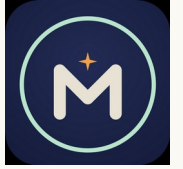

Sort by Votes from largest to smallest, using the heading setting for your software.

Keep each activity attached to its own count. Leave the Total row outside the sort.

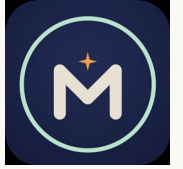

Sort the whole table together — continued

What order should appear after the sort?

Read the fictional votes

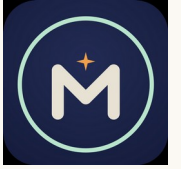

Make a chart that tells the truth

Select A1:B5 and insert a simple bar or column chart. Do not include the Total row.

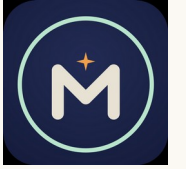

Title: “Fictional Makers Club choices”. Label the categories and votes; use an axis starting at zero.

Check that each bar matches its category and count.

Make a chart that tells the truth — continued

Why is Total not another activity bar?

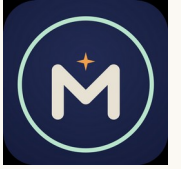

Say only what the data supports

Model making received the most votes: 9. Drawing received 7, so the gap is 2.

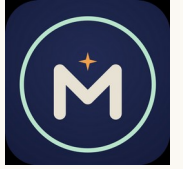

Nine out of 24 is less than half, so it is not a majority.

The data describes this fictional vote; it does not tell us what everyone likes.

Say only what the data supports — continued

Improve: “Most people chose model making.”

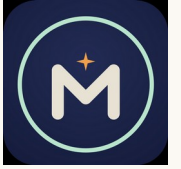

Save and check the workbook

Save as GROW_W5_Club_Votes_v1.xlsx in the approved folder; an approved native workbook format is also possible.

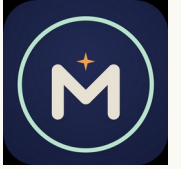

Reopen and check the four data pairs, formula result and chart.

CSV can store the basic table, but use a workbook format to keep this formula/chart project.

Save and check the workbook — continued

What checks prove more than a total of 24 alone?

Answer with evidence

Which activity leads? What is the gap to the next option?

State one thing these numbers cannot tell us.

Give a complete answer.
