Knowledge organiser

One cell becomes two daughter cells with matching A and B sets.

I am learning to use the cell-cycle sequence to find and repair errors and explain matching chromosome sets.

Tier 2 words

Word	Meaning
order	Put steps into a sequence.
matching	Having the same relevant information or parts.
predict	Use what you know to say what might happen.
repair	Replace or mend something damaged.

Tier 3 words

Word	Meaning
cell cycle	The series of steps in which a cell grows and divides.
interphase	The stage in which the cell grows and copies its DNA.
mitosis	The stage in which copied chromosomes separate into two nuclei.
chromosome	A structure of DNA that carries genes.
cytokinesis	The division of the cell after the nuclei form.
prophase	The mitosis phase when chromosomes condense.
metaphase	The mitosis phase when chromosomes line up in the middle.
anaphase	The mitosis phase when the two copies of each chromosome are pulled to opposite ends.
telophase	The mitosis phase when two new nuclei form.

Sequence: interphase → prophase → metaphase → anaphase → telophase → cytokinesis.

How I know: I can order interphase, the four mitosis phases and cytokinesis. I can find the first wrong step and show a scientific repair. I can explain how the repaired model gives both new body cells matching chromosome sets.

You can plan in any language. Speak before you write: “The daughter cells match because …”
