Reference A matching chromosome sets

Compare the full A and B set in both daughter cells. Each new cell has a matching set.

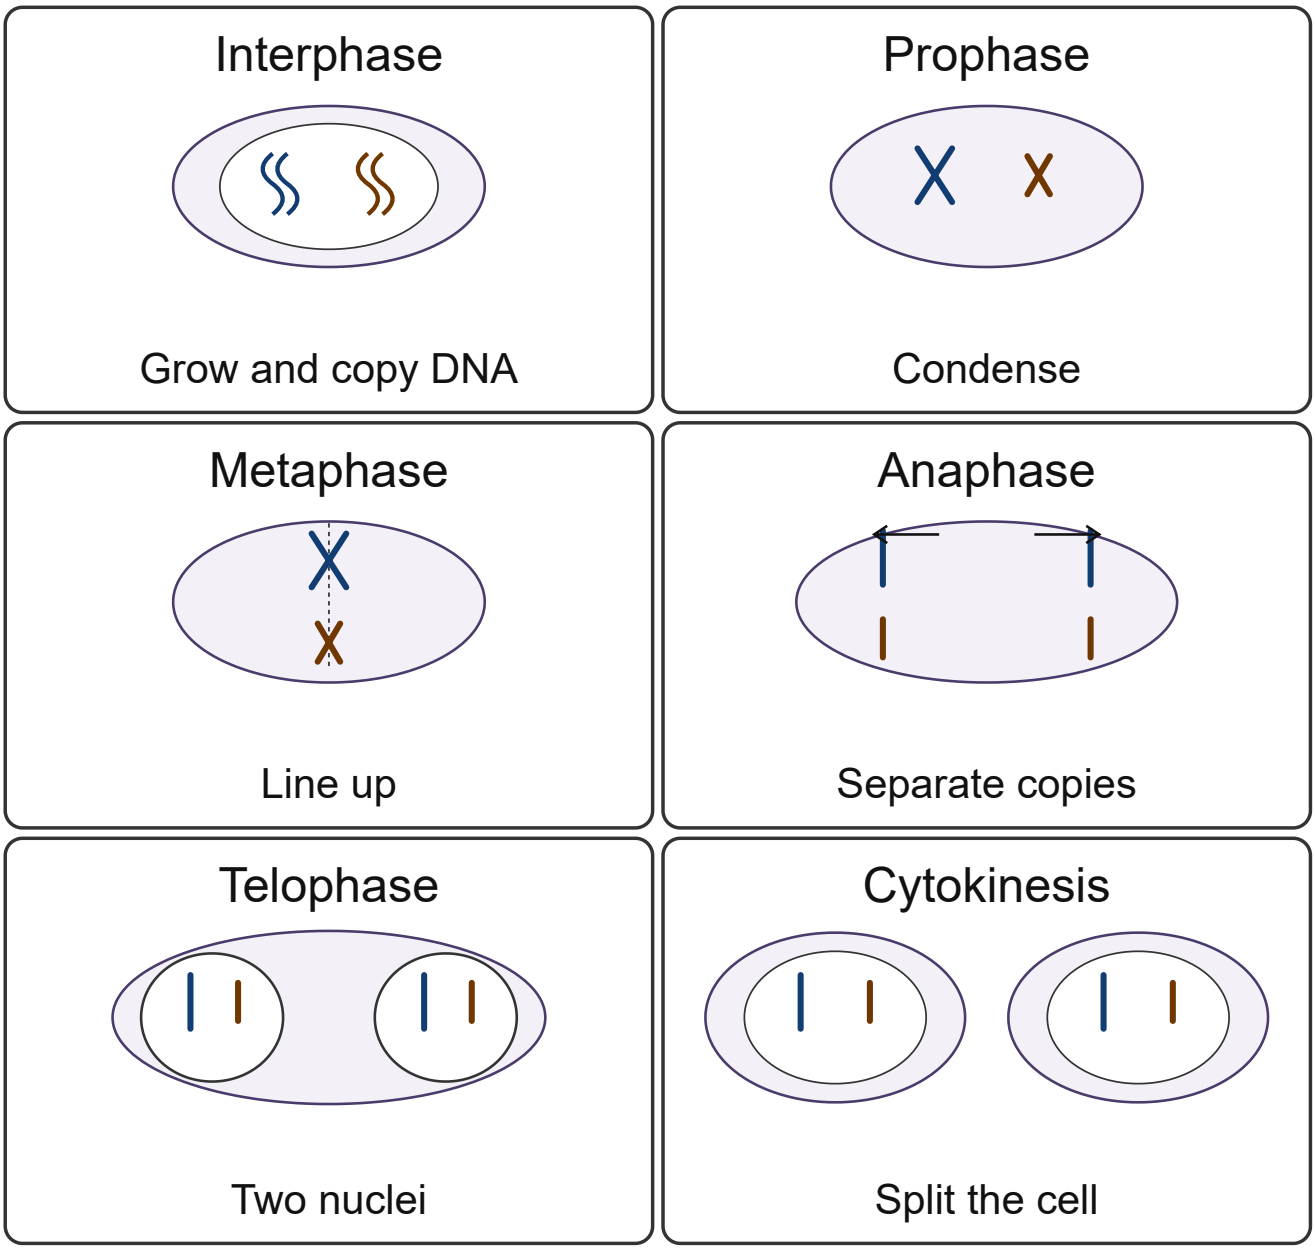

Reference only. Use labels as well as colours. The symbols are simplified chromosome types, not a full picture of real DNA.

Step	What changes
Interphase	The cell grows and copies its DNA.
Mitosis	Copied chromosomes separate into two nuclei.
Cytokinesis	The cell splits into two daughter cells.

In the number case, six chromosomes in the starting body cell means six in each daughter after ordinary mitosis and cell division. A fresh case starting with eight gives eight in each daughter.

Made by Matt

Reference B the six named stages

Interphase, prophase, metaphase, anaphase, telophase and cytokinesis. Four middle phases belong to mitosis.

Reference only. Interphase comes before mitosis. Cytokinesis follows the formation of the two nuclei. The four named mitosis phases are prophase, metaphase, anaphase and telophase.

Made by Matt

Arrival and exit Aspire

Use the labelled picture on Reference A for question 1. Respond in your usual mode.

1. Using the picture alone, state the number of separate cells after the final split.

2. Which labelled cell structure contains the chromosome set?

3. Explain what the A and B labels show about the sets in the two new cells.

4. Give one change shown by the model and one thing its simplified symbols do not show.

Exit ticket

1. A correct final split follows uneven chromosome separation. Do the new sets match? Explain.

2. Give the first repair for skipped copying and explain why it matters before later stages.

Pupil voice

What helped you most today, or what would you change next time?

Point, speak, sign, draw, write or choose. You may pass.

verbal · written · drawn · signed · symbol / choice-selected · demonstrated / re-attempt · adult-scribed. You may pass.

Made by Matt

You do Aspire

Use your book or this sheet. Use Reference A and B. One response per task.

1. Predict what happens if copied chromosomes separate unevenly. Explain why a correct final split cannot fix the sets. [3]
Staff I ☐ S ☐ C ☐

---

2. Explain why copying DNA after mitosis would break the sequence needed for matching new body cells. [3]
Staff I ☐ S ☐ C ☐

---

3. Compare the two faulty models: copying skipped, and both A copies sent to one end. Repair each first error, then link the repaired sequence to new cells for repair. [4]
Staff I ☐ S ☐ C ☐

Feedback and response · Aspire

My response

Record one response to feedback in your usual mode. You may pass.

Adult checks the response and ticks it, or writes R (Pupil responded to feedback).
