

Muscles work in pairs

Two muscles. Two pulling jobs.

I can explain a bend and an active straighten at the elbow.

Watch a bend and a straighten

Watch the adult's card arm model.

Which pull makes the model bend?

Which pull makes it straighten?

Three things we will do

Meet the muscle pair.

Compare a bend and a straighten.

Explain which muscle contracts.

A model helps us see a pull

Card represents bones. The join represents an elbow.

Loose string represents a muscle pull; it does not contract itself.

The body has a working pair

BEND THE ELBOW

Biceps contracts.
Triceps relaxes.

ACTIVELY STRAIGHTEN

Triceps contracts.
Biceps relaxes.

Choose the pulling muscle

The card arm bends.

Choose: biceps or triceps contracts?

Say, sign or point before the explanation.

Now swap the action

The model actively straightens.

Which muscle contracts now?

What happens to its partner?

Model and muscle: compare

WHAT THE MODEL SHOWS

A joint allows movement.
A pull acts on each side.
The roles can swap.

WHAT IT DOES NOT SHOW

String does not shorten itself.
Card is not living bone.
This is a simplified elbow.

Explain both muscle jobs

When the elbow bends, the biceps contracts and the triceps relaxes.

When it actively straightens, the pair swaps jobs.

True or needs correcting?

READ EACH CLAIM

Muscles can pull.
Muscles can push bones.
Biceps and triceps form a pair.

EXPLAIN THE CORRECTION

Which claims fit the model?
Which word needs changing?
Show the action that supports you.

Direct two moves and keep labels

Direct one bend and one active straighten.

Place CONTRACTS and RELAXES labels.

Check one swap and correct it if needed.

Keep the labels for Wednesday.
