Resource use and climate evidence

Objective: Explain resource use and climate change using online data.

resource something people use to meet a need	evidence information used to support a claim
territorial occurring within a defined territory; here, the UK	emissions gases released into the atmosphere
MtCO₂e million tonnes of carbon dioxide equivalent; combines greenhouse gases using their warming effect	limitation a reason evidence cannot answer every question

Remember: A fall in emissions is not a fall of the same number of degrees. These are net annual UK territorial emissions, not atmospheric concentrations or the whole UK consumption footprint.

Show learning: Use two figures to describe an emissions pattern.

World of work: A sustainability analyst checks data provenance before advising a council. Use a figure, a geographical boundary and a limitation to make your advice trustworthy.
