Knowledge organiser

I can pair one allele from each parent.

I can find the aa chance in four squares.

I can evaluate why probability does not guarantee an exact count.

I am learning to calculate genetic probability with a Punnett square and evaluate its limits.

Aa × aa · side / top	**A**	**a**
a	Aa	aa
a	Aa	aa

One top allele plus one side allele makes one pair. Count two aa boxes out of four. The aa chance is one half for each offspring.

This is a simple model for one gene. A dominant allele is not stronger, better or more common. Each fertilisation is a new chance. Do not use real family traits or ask for personal or medical details.

Word	**Meaning**
allele	a version of a gene
genotype	the pair of alleles shown by letters
dominant	an allele shown by one copy in this simple model
recessive	an allele shown when two copies are present in this model
Punnett square	a grid of possible allele pairs
