Convert fractions to percentages and ratios.

Calculate expected numbers and compare observations.

Explain why each fertilisation is independent.

Convert genetic probabilities between fractions, ratios and percentages, and explain why observations vary.

Aa × Aa · side / top	**A**	**a**
A	AA	Aa
a	Aa	aa

AA : Aa : aa is 1 : 2 : 1. With complete dominance, the phenotype ratio is 3 : 1. The aa chance is 1/4 = 25%.

Chance × total gives an expected count. Count ÷ total × 100 gives an observed percentage.

This is a simple model for one gene. A dominant allele is not stronger, better or more common. Each fertilisation is a new chance. Do not use real family traits or ask for personal or medical details.
