

I am learning to show how a gene is part of DNA and how DNA is packed into chromosomes.

Words to use

Word	Meaning	Example	My language
DNA	the molecule that stores genetic instructions	DNA contains the instructions for making proteins.	
gene	a section of DNA that codes for a specific protein	The coloured section of the model stands for one gene.	
chromosome	a long DNA molecule packaged with proteins in a cell	A chromosome contains many DNA sections, including genes.	
genome	the entire DNA of an organism	The genome includes all of the organism's chromosomes and other DNA.	

Model

The genome is the full DNA set; a chromosome carries part of it; a gene is a section of DNA on a chromosome. Nested view; not to scale.

Mark a short section of a DNA cord as a gene. Coil the cord as one chromosome; place it inside a border for the genome. Name the section, molecule, package and complete DNA set.

How I know

I can label DNA, a gene and a chromosome in a simple model.

I can explain that a gene is a section of DNA with a protein instruction.

I can distinguish one chromosome from the genome.

You can plan in any language. Speak before you write: Speaking: “Move this label because ...”
