

I am learning to use cell and inheritance models to show what I know and choose one next step.

Words to use

Word	Meaning	Example	My language
mitosis	division of the nucleus to separate matching chromosome sets	Mitosis helps make matching body cells.	
gene	a section of DNA that codes for a protein	A gene is a part of the DNA string.	
allele	a version of a gene	A and a stand for two alleles in our invented model.	
evidence	a fact or model detail that supports a claim	The labelled chromosome sets are evidence for my answer.	

Model

Three separate rehearsal pictures: mitosis, a gene on DNA, and a Punnett square. Simplified; not to scale; not answers to the independent check.

Parallel example (not one of the check items): label a body-cell model with copied chromosome sets, then explain that mitosis separates them into two nuclei. Point to a model detail that supports the answer. Now cover the labels for the independent check.

How I know

- I can order copy, separate and split for mitosis.
- I can mark one gene as part of DNA.
- I can use a simple cross as probability, not a promise.

You can plan in any language. Speak before you write: My answer is ...
because the labelled model shows ...
