Tier pack: Supported route — The local canvas: architectural line and form

Pathway: TRACK · Week 1 Part 2 · Big question: How can we use structural line, negative space, and surface frottage to record built architecture?

Supported route studio steps

Step 1: Rub a light graphite texture across your page using two textured plates.

Step 2: Use the triangle negative-space guide to map the inner gaps of a truss span.

Step 3: Join the beams around the gaps using a ruler and black fineliner.

Step 4: Thicken the front beam edges so they stand out over the texture ground.

Success check

Texture ground with accurate negative-space truss drawing and varied line weight.

Key words helper

• negative space: The open air gaps and shapes trapped between solid beams.

• truss: A rigid framework of steel or timber beams arranged in repeating triangles.

• line weight: Varying line thickness from light construction lines to heavy foreground edges.

Review checklist

[ ] Check that the triangle sky gaps (negative spaces) match the angles on your reference card.

[ ] Verify that your nearest beams have the thickest, darkest lines.

[ ] Ensure your three technical labels point cleanly to the matching features.
