TA studio brief — Material implementation and critical development

Pathway: SUMMIT · Week 3 Part 2 · Big question: How do we translate our Week 1-2 studio brief and joint prototypes into a multi-level structural relief build?

TA practical setup & focus

Count all safety rulers and cutting tools out and back into table blocks; provide small card spreaders so PVA glue is applied in thin, clean films.

Studio kit: Week 1 Studio briefs, Week 2 joint prototypes, A3/A4 heavy greyboard bases, cutting mats, safety rulers, corrugated fluting, craft foil, dark acrylic primer, PVA

Key words to prompt

• implementation: Turning a drawn design brief and prototype into the full physical artwork.

• plane: A distinct flat or textured depth level (background plane, midground plane, foreground plane).

• cantilever: A rigid structural beam that projects horizontally beyond its vertical support.

• monolithic: Reading as one unified, heavy, solid structure rather than separate scraps.

• shadow line: The crisp dark line cast underneath a projecting relief flange.

Supported route steps

1. Lay your Week 1 brief beside your greyboard base and glue your Plane 1 textured background strips.

2. Laminate and glue your Plane 2 main structural beams over the background leaving clear triangle voids.

3. Attach plane 3 embossed foil gusset plates at the main beam corners.

4. Brush dark primer into the recessed seams and tick the mid-build check on your log sheet.

Check: Three-plane relief structure assembled, primed in recesses, and logged.

Review & exit support

Exit question: How do you create a deep 'undercut' shadow line beneath a foreground card beam in relief construction?

Staff note: Staff preparation only: review how to demonstrate three-plane relief assembly and hidden spacer strips for undercut shadows.
