Grip or glide? The surface challenge · TA Brief

Learning goal: I can explain how friction acts between touching surfaces and judge when grip or glide is useful.

Watch (staff preview first)

Short silent teacher demonstration clip for this lesson's model and practical sequence · preview before class use.

Adult Support Routine

No cold calling; nobody is asked to read difficult text aloud.

Give time to start -> point to the relevant place -> rephrase -> offer a small prompt or word bank -> reduce to a limited choice.

Beside the You do in the pupil book, mark I (independent), S (supported) or C (choice).

Must-Know Words

friction: a contact force between two surfaces that slide or try to slide past each other

contact force: a force that acts only when two objects or surfaces touch

grip: high resistance to slipping between two touching surfaces

lubrication: adding oil or grease to reduce unwanted friction between moving parts

Key Answers

A. High friction between the brake pad and rim resists relative sliding and slows the wheel.

A. Smooth surfaces still experience friction; whether it helps depends on the surface pair and the job.

1. To the left (opposite to sliding). 2. Brake pad and wheel rim (or shoe sole and floor). 3. The two touching surfaces, the relative motion, and the intended job.
